Application: Thesis Volume Planning and AI-Driven Forecasting Concept

Dear Sir or Madam,

I am writing to apply for the thesis opportunity “Thesis Volume Planning and AI-Driven Forecasting Concept” at MAN Truck & Bus Group. The combination of technical content and practical work is exactly what I am looking for.

Since March 2026 I have been studying the Master's programme Product Development and Business Studies at Hamm-Lippstadt University of Applied Sciences (expected completion 07/2027), focusing on product development, project management and product and sales management; several modules are taught in English. My Bachelor's degree in Biomedical Engineering (completed November 2025) gave me a technical foundation in electrical engineering, measurement technology, materials science, product testing, digital image and signal processing, artificial intelligence and IT security.

I have applied Python, machine learning and deep learning in my studies and my Bachelor's thesis (brain tumour classification, grade 2.0), and developed a genetic algorithm for fusing MRI and CT images during my internship semester in Taiwan. I am happy to get up to speed quickly with SQL, Power BI.

The role fits well alongside my Master's studies, which end in July 2027, so I can support you over a longer period; I am happy to agree the working hours with you. German is my native language and my English (B2) is solidified through English-taught modules. I also volunteer with the Ense-Bremen volunteer fire brigade, which has strengthened my teamwork and sense of responsibility.

I would be delighted to introduce myself in a personal interview.

Kind regards

Philipp Humpert
